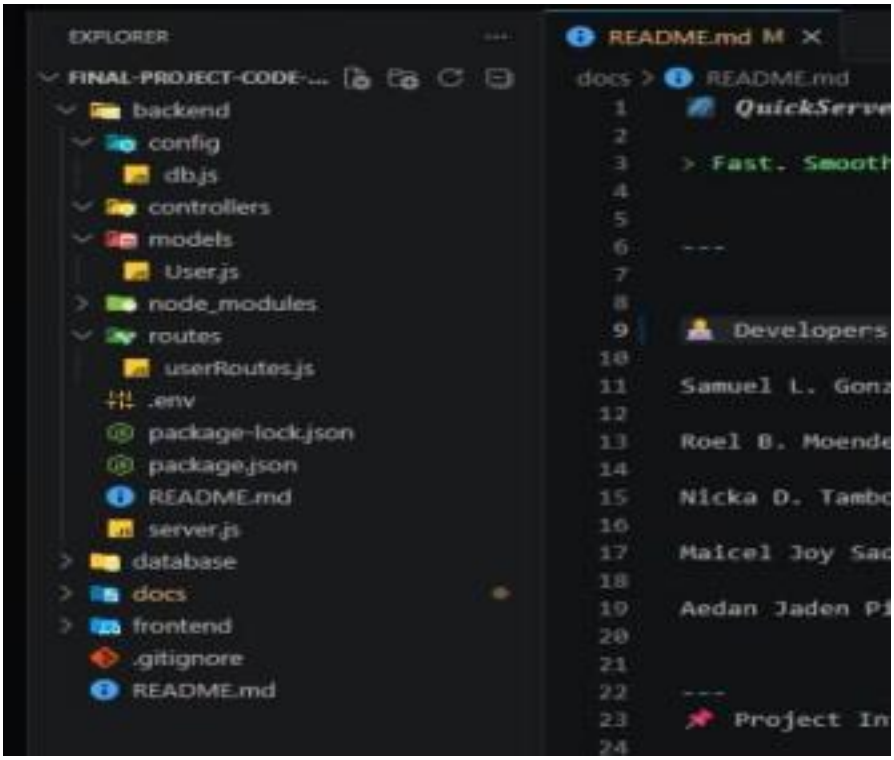
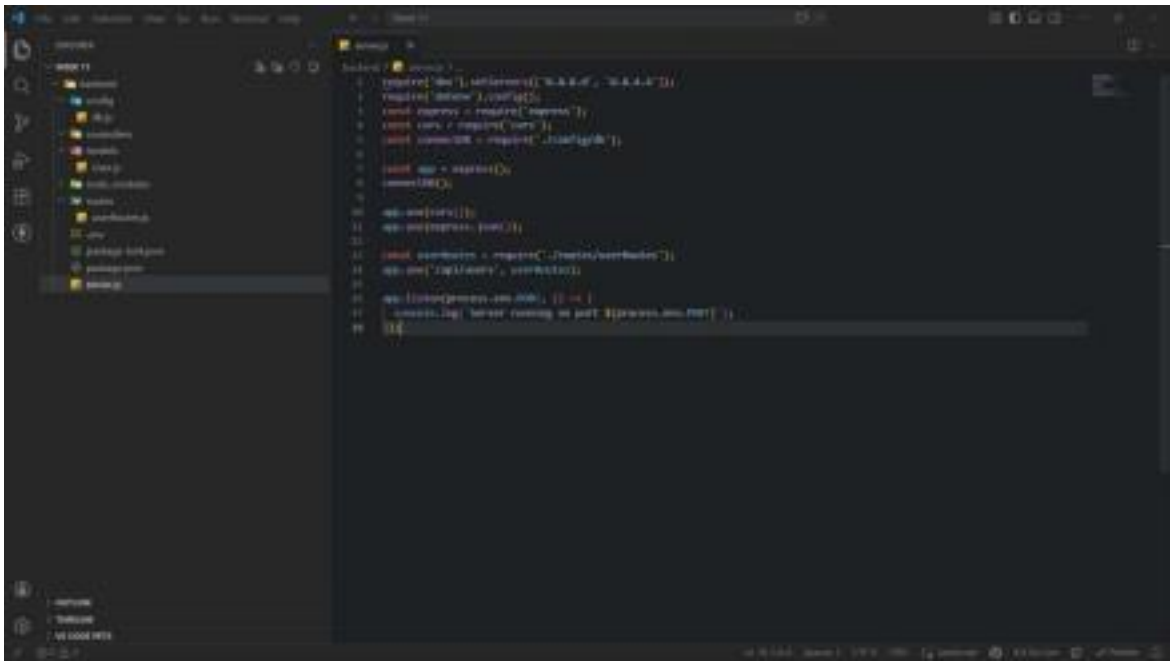
Overview of Backend Setup

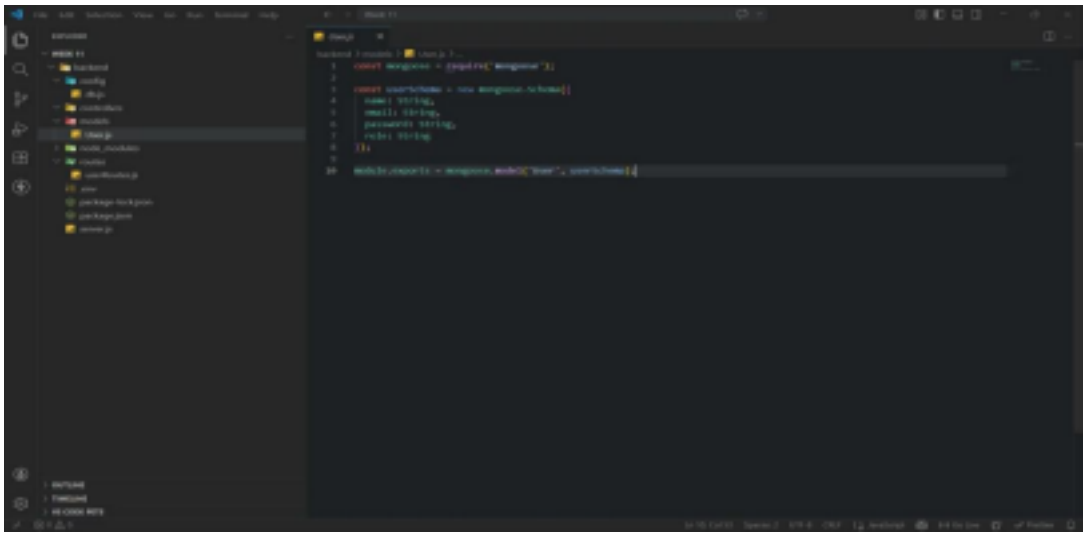


CODE SNIPPETS

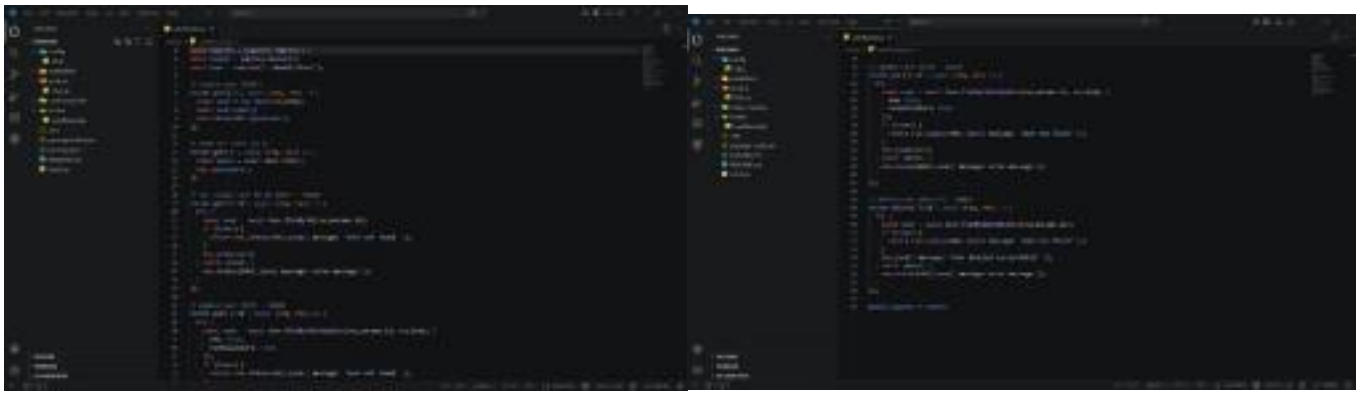
server.js



sample model

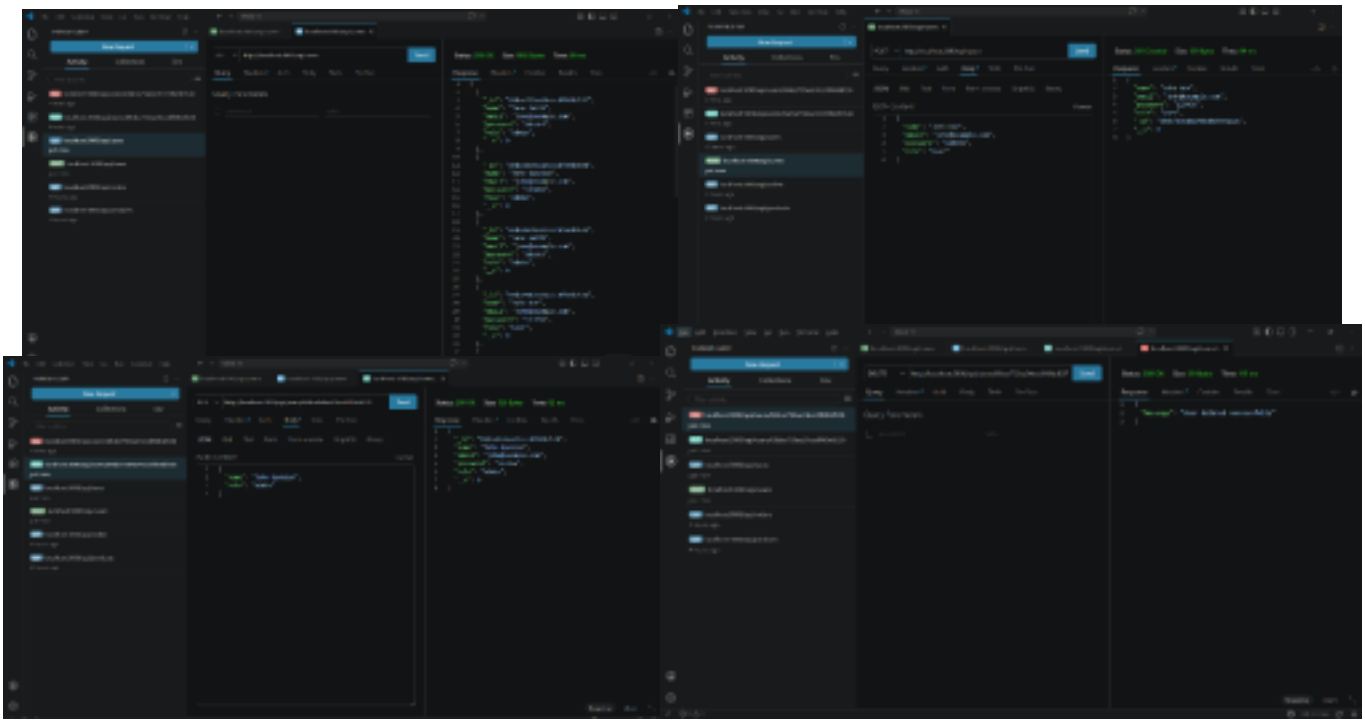


routes

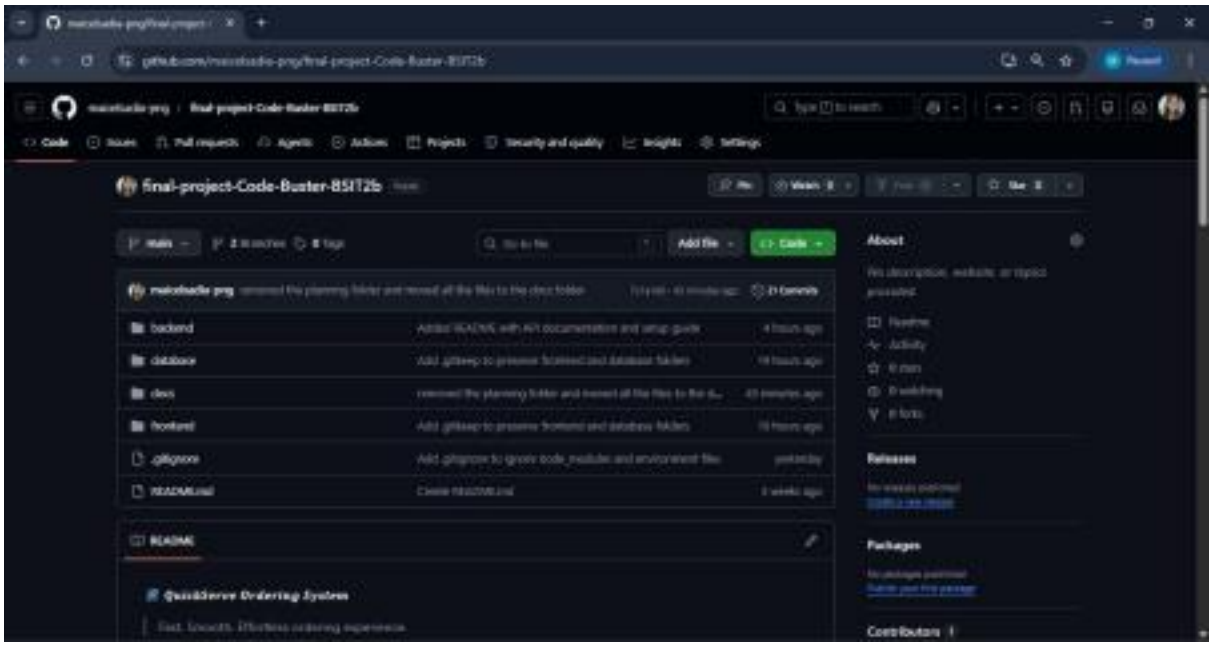


This code is basically a simple backend setup that lets you manage users in a database using Express.js with the help of Mongoose. It creates different routes that handle common actions: adding a new user, viewing all users, checking a specific user by their ID, updating user details, and deleting a user. Each route talks to the database in an asynchronous way so the server doesn't get stuck, and it sends back clear responses like success messages, the requested data, or errors if something goes wrong (like when a user can't be found). In simple terms, this file acts as the bridge between what the client requests (like from a frontend or Postman) and what happens in the database, making sure everything runs smoothly and responses are returned properly.

API TESTING



GitHub commits



Brief explanation of each group member's contribution

Samuel Gonzales

As the backend developer, I was responsible for setting up the server and building the core functionality of the system. I created the Express server, organized the project into proper folders, and developed the API routes, models, and configurations needed for the application to run. I also ensured that the backend could connect to the database and handle data properly, making it ready for integration with the frontend.

Aedan Jaden Pielago

As a database manager, I was responsible for creating an API using MongoDB to store and manage data efficiently. I used Mongoose to make database work easier by organizing the data into clear structures, making sure the data is correct, and linking related data together. This helped ensure that the system runs smoothly and that data can be accessed and managed properly.

Maicel Sadia

As the GitHub Manager, I was responsible for organizing and maintaining our group repository, ensuring all files were updated and properly uploaded on time. I managed commits, pushed updates, checked my teammates' contributions, and assisted members who had difficulty using GitHub. I encountered challenges such as failed pushes, merge conflicts, and repository errors, which I resolved by analyzing error messages and applying appropriate Git commands. Despite these issues, I successfully kept the project organized while improving my technical skills, patience, and problem-solving abilities.

Nicka Tambobong

As the Documentation Officer, I was responsible for capturing all the necessary screenshots for the lab report based on the given requirements. I also explained the route functionality, where the code defines user-related API routes using Express.js to perform basic CRUD operations. These routes allow clients to create users (POST), retrieve all or specific users (GET), update user information (PUT), and delete users (DELETE), while interacting asynchronously with the database and handling errors properly. Through the screenshots, I demonstrated how each route responds to user actions and how data flows within the system. I worked closely with my groupmates to ensure that the documentation accurately reflected the implementation, making the lab report clear, organized, and easy to understand.
