Sample backend API response (console or Postman)

Annotated JavaScript snippet used for rendering data

```
123 // Convert API response to JSON format
124 const reviews = await response.json();
125
126 if (!reviews || reviews.length === 0) {
127   reviewsContainer.innerHTML = `<div class="text-center py-4">No reviews yet. Be the first to review!</div>`;
128   return;
129 }
130
131 // Render product data into the HTML page
132 reviewsContainer.innerHTML = '';
133
134 reviews.forEach(review => {
135   const stars = '★'.repeat(review.rating) + '☆'.repeat(5 - review.rating);
136   const reviewHtml = `
137     <div class="review-card">
138       <div class="review-header">
139         <div class="reviewer-info">
140           <strong>${review.userName || 'Anonymous'}</strong>
141           <div class="review-stars">${stars}</div>
142         </div>
143         <span class="review-date">${new Date(review.createdAt).toLocaleDateString()}</span>
144       </div>
145       <p class="review-text">${review.comment}</p>
146     </div>
147   `;
148   reviewsContainer.insertAdjacentHTML('beforeend', reviewHtml);
149 };
```

Github commits logs

The screenshot shows the GitHub 'Commits' page for the 'main' branch, filtered for 'All users' and 'All time'. It displays a list of commits from May 5, 2026. Each commit entry includes a title, the author's name and profile picture, the time since the commit, a 'Verified' badge, a commit hash, and icons for cloning and comparing.

Commit Title	Author	Time	Verified	Hash	Cloning	Compare
ReadMe	maicelsadia-png	authored 4 days ago	Verified	fb901d5	📄	<>

Short reflections

Frontend

For Phase 5, my main goal was to retrieve live data from the backend and render it in the front end dynamically. The main difficulty I encountered was to get the sort and filter functionalities working with dynamically generated product data; I managed to solve that problem by changing my logic on filtering from hiding items to arranging elements on the DOM. By the time we completed this phase, our Products, Dashboard, and Orders pages successfully fetched live data from our API.

Backend

As the Backend Developer, I was responsible for making sure that the GET endpoints returned the correct data for the frontend to display properly. Working on this task helped me better understand how the backend connects with the frontend and how important APIs are in a web application. I also realized that clear communication and teamwork are important to make the whole system work smoothly.

Github

As a GitHub Manager, my role was to manage the repository and make sure all changes were properly merged into the main branch without conflicts. I learned how important communication and teamwork are when handling different contributions from group members. I also faced challenges, especially when fixing merge conflicts and organizing commits, but these experiences improved my problem-solving skills. Overall, this role helped me become more responsible and knowledgeable in using GitHub for collaborative projects.

Documentation

As the Documentation Officer for our system, QuickServe, my responsibility was to document the data outputs and capture screenshots showing the real-time data rendering of the system. I made sure that the screenshots and records were clear and organized so our lab report would properly show how the system works. Although we experienced delays because some requirements were incomplete, I still learned how important teamwork, communication, and time management are when preparing project documentation.
