Screenshots of ALL working frontend pages

Annotation showing which feature/use case each page covers

1. Homepage

Annotation:

The Homepage serves as the main entry point of the QuickServe Ordering System. It introduces users to the platform and provides easy navigation to key actions such as login and registration. This page may also highlight featured menu items, promotions, or system information to engage users.

Use Case:

Allows users to access the system, explore basic information, and navigate to login or sign-up pages.

2. Login Page

Annotation:

The Login Page of the QuickServe Ordering System allows registered users (both customers and administrators) to securely access their accounts by entering their email and password. It serves as the system's authentication gateway, ensuring that only authorized users can access protected features such as ordering, account management, and administrative controls.

Use Case:

User authentication – logging into the system to gain access to personalized features and functionalities.

3. Registration Page

Annotation:

This page allows new users to create an account in the QuickServe Ordering System by entering required information such as name, email, and password. It ensures that user details are properly collected and stored in the database, enabling secure access to the system. This page supports input validation to prevent errors and ensures that only valid and unique user data can be registered.

Use Case: User account creation and data registration.

4. Products Page

Annotation:

This page displays all available products in the QuickServe Ordering System, including item names, prices, and short descriptions. It allows users to browse food options, view basic details, and select items they want to order. This page may also include features like search, filtering, or categorization to make it easier for users to find specific products.

Use Case: Browse and select products for ordering.

5. Product Details Page

Annotation:

This page provides complete information about a selected product in the QuickServe Ordering System, including its name, price, description, and available quantity. It allows users to review the item carefully and choose the desired quantity before adding it to their cart or proceeding to order. This page helps customers make informed decisions by showing specific details of the product.

Use Case: View detailed product information and select item for ordering.

6. Shopping Cart Page

Annotation:

This page displays all the selected food items that the customer has added from the menu or product details page. It allows users to review their chosen items, update quantities, or remove products before proceeding to checkout. The shopping cart serves as a temporary storage of orders, ensuring customers can still modify their selections before final confirmation.

Use Case: Review, edit, and manage selected items before placing an order.

7. My Orders Page

Annotation:

This page shows a complete record of all orders placed by the customer in the QuickServe Ordering System. It displays order details such as order ID, items ordered, total amount, date of purchase, and current status (e.g., pending, preparing, completed, or cancelled). This page allows users to track their orders and monitor their progress after checkout.

Use Case: View and track the status and history of all placed orders.

8. User Dashboard

Annotation:

This page serves as the main control center for customers after logging into the QuickServe Ordering System. It provides a summary view and quick navigation to key features such as the menu, shopping cart, and order history. It may also display updates, announcements, or featured products to guide user activity within the system.

Use Case: Access and navigate main customer features and overview of system activities.

9. Admin Dashboard

Annotation:

This page serves as the central control panel for administrators in the QuickServe Ordering System. It provides an overview of the system's overall activity, such as total orders, active users, and recent transactions. From this dashboard, admins can quickly navigate to management features like product, order, and user management. It helps ensure smooth operation and monitoring of the entire system.

Use Case: Monitor system performance and access all administrative management functions.

10. User Profile Page

Annotation:

This page allows users to view and manage their personal account information in the QuickServe Ordering System. It typically includes details such as name, email address, contact information, and password settings. Users can update their profile to ensure their account information is accurate and up to date.

Use Case: View and update personal account details and settings.

GitHub folder structure

Individual reflections

Roel Moendem

As the Frontend Developer, my role was to develop and troubleshoot the product details page in order to load correct product details whenever users click on the link. The implementation of a dynamic product loading mechanism with URL parameters and JavaScript enabled me to add individual product pages with detailed product information such as name, price, description, availability, and product images. I also included user login verification to ensure no one could add any items into cart or submit review without logging into their accounts. The most challenging part was to display the product detail information of all eight products correctly. However, this problem was resolved after developing a product database and fetching information by checking the product id through URL parameters. Through this project, I learned how to turn a static HTML page into a dynamic page along with passing data to other pages.

Samuel Gonzales

As the Project Manager, I made sure our team stayed on track with the plans we created in Phase 1. I checked in regularly with everyone, helped clear up any confusion, and made sure we all understood what needed to be done. There were times when things felt a bit unorganized, but I tried to keep everything aligned and moving forward. Overall, I believe my role helped the group stay focused and work together more smoothly.

Maicel Sadia

As the GitHub Manager, my role is to organize and maintain our project repository to ensure a smooth workflow for the team. I set up the proper folder structure, including the /frontend directory, and made sure all files such as HTML, CSS, JavaScript, and assets are placed correctly. I guided my teammates on how to commit and push their work properly, ensuring that commit messages are clear and changes are well-tracked. I also checked that all updates are complete, organized, and aligned with the project requirements, including uploading screenshots and updating the README file. Despite some challenges with syncing and managing commits, I ensured that our repository remains structured, consistent, and ready for collaboration.

Nicka Tambobong

As the documentation officer of our system, this part reflects how the UI effectively aligns with both the use cases and the Entity Relationship Diagram of our QuickServe Ordering System. It shows that every feature visible to the user such as ordering, product selection, and transaction processing is not just designed for usability, but is also directly supported by the system's underlying data structure. I see this connection is important because it proves that the system is consistent and well-integrated. The UI is not created randomly; instead, it is based on defined user needs (use cases) and structured data relationships. For example, when a user places an order, the interface interacts smoothly with the database entities like products, orders, and customers, ensuring accurate data flow and functionality.
